Find out more about our chicken tractors.

### Basic 4x8x2 chicken tractor

This basic chicken tractor is designed for broilers. It uses a five gallon bucket to supply a gravity feed watering system. We use hanging feeders that can be obtained at most feed stores. The split roof design allows for easy access.

### Closeup of waterer

This was a waterer that we were testing last year. It worked well when level but tended to overflow when it wasn't. Which was all too often on our land. We switched to cups that work much better for us on our rough field.

Closeup of bucket tap

This was a "prefab" bucket that we purchased for testing. Note that it doesn't have a shut-off valve.

Split top with bucket support

We use a split top design for easy access.
